

## Versora Press Release

### **Versora Announces Progression Desktop for Windows Version 3.5, Offering Enterprise Support for Migration to Windows Vista**

*New Progression Desktop for Windows 3.5 capabilities includes 2000/XP to Vista migration, migration of multiple user accounts, migration to Windows Mail & Office 2007, and access to source code for ease of integration.*

**Santa Barbara, CA – January 31, 2007** – Versora the market leader in cross platform migration technology announced today that Progression Desktop for Windows 3.5 will be generally available February 28, 2007.

“Progression Desktop for Windows 3.5 is the most advanced migration tool on the market that helps companies migrate to Microsoft Windows Vista, notes Versora Chief Software Engineer Nick Lassonde. “Not only do we support all of Microsoft’s core desktop applications, we also support moving between other popular vendor applications such as IE and Firefox or Eudora and Windows Mail (Outlook Express).”

Progression Desktop 3.5 is the only enterprise capable personality migration tool available offering such widespread platform support. In addition to being the only tool that supports migration of popular open source applications, Progression Desktop’s unique Platform Neutral storage allows migration between different applications. This feature offers organizations the opportunity to preserve valuable application data even when standardizing on new applications. Some examples are support for migration between Microsoft Office and OpenOffice.org, AOL Instant Messenger and GAIM, Microsoft Outlook, Outlook Express, Eudora and Mozilla Thunderbird.

Progression Desktop for Windows 3.5 yields dramatic time and cost savings for desktop migrations via an easy to use “Next-Next-Finished” wizard interface. Migrations can also be fully automated from a command line to allow integration with third party system management tools from companies such as Altiris, BMC, HP, Microsoft, Novell and others.

Progression Desktop for Windows is distributed under an Enterprise Source License (ESL) which allows the administrator the option of viewing and modifying the source code to meet any of the organization's specific needs. The ESL also gives the organization control over future development of the code to avoid lock-in to a specific vendor.

Progression Desktop for Windows 3.5 will be available for purchase February 28, 2007. For product information, visit:
